Note: Ideally an up-to-date one-line electrical drawing of the building to be protected facilitates the selection of the proper surge protective devices (SPDs) and helps verify the correct line voltages (Wye/Delta) are identified. Regardless, a complete walk through site survey of the facility is recommended to ensure all critical locations are identified and targeted for surge protection. This includes the electrical switchgear at the service entrance, all distribution panels and critical branch panels, as well as key point of use locations including but not limited to the datacenter and UPS equipment, automatic transfer switches and generators, security cameras and recording devices, fire alarm and annunciation equipment, telecom and network closets/racks, industrial and factory automation equipment, and HVAC heating and cooling systems. In addition, protection for all copper conductors that penetrate the structure should be considered for full facility protection.

#### IEEE EMERALD BOOK RECOMMENDED LOCATIONS

□ Y	N	Service Entrance (8.6.3) SPD	If none present, note for follow-up and proper sizing later.
-----	---	------------------------------	--

Distribution Panels (8.6.4) SPD If none present, note for follow-up and proper sizing later.  $\Box Y$  $\square N$ 

 $\Box Y$ Critical Branch Panels (8.6.4) SPD If none present, note for follow-up and proper sizing later.

#### Service Entrance
